### 1 About

The use of go (alias golang) is a pretty successful one. The language has been used successfully to development REST-API services and front-ends. The advantages of this language and in particular the implementation are:

- no virtual CLR or JRE runtime, so comparably small and fast
- every installation contains all components for cross-compilation
- successfully compiled the same application for ARM5, ARM7, ARM64, and AMD64 environments
- libraries looks like designed from programming professionals, not lecturers
- good, helpful community existing

## 2 Directory Design

# 3 Helper Scripts

The scripts are all part of the ConfigShell/bin directory. They can be classified like:

- 1. compilation scripts
- 2. version-number increase and compilation scripts
- 3. execution scripts to execute the last compiled binary
- 4. status check scripts
- 5. cleanup scripts
